Country and region information contained in this report is based upon MFS classification methodology which may differ from the methodology used by individual benchmark providers. Portfolio characteristics are based on equivalent exposure, which measures how a portfolio's value would change due to price changes in an asset held either directly or, in the case of a derivative contract, indirectly. The market value of the holding may differ.

Market Overview

Global Equity performance (%) (CAD) as of 30-Jun-20

Source: FactSet. Region performance based on MSCI regional/country indexes.

Canadian Equity performance (%) (CAD) as of 30-Jun-20

Source: FactSet. Sector performance based on MSCI sector classification. The analysis of TSX Composite Index constituents are broken out by MSCI defined sectors.

Second quarter 2020 Global Equity market review

- The global equity market has recovered most of the loss from the Covid-19 selloff despite a steep recession and still-expanding global infections.
- The strong equity market rally since late March has been largely driven by unprecedented stimulus policies, coupled with some improvements in economic and earnings data.
- A notable feature has been increased market concentration in a handful of large technology-related stocks, which outperformed during both the selloff and the rebound, while the uncertainty of recovery has driven volatile returns across most of the market.
- Without a broad treatment or vaccine available quickly, the path forward may be bumpy as governments may be forced to slow or reverse re-opening policies.

Second quarter 2020 Canadian Equity market review

- Record government and central bank intervention aimed at mitigating the impact of COVID-19 shutdowns generated an unparalleled rebound in equity prices in the second quarter of 2020. This reversed the majority of the equity price weakness experienced in the first quarter.
- During this second consecutive quarter of extreme market volatility, Canadian equities (S&P/TSX Composite) rose 17%, reversing much of the 21% decline of the first quarter. Canada's performance in Q2 was roughly in line with US equities, and ranked well globally. Year to date, Canadian equities lagged those in the US, reflecting Canada's higher proportion of energy stocks.
- The Canadian equity contribution in Q2 was narrow, with about 60% of the gain driven by technology and materials stocks, largely Shopify and precious metals stocks (gold). On a year-to-date basis this was even more pronounced, with technology and precious metals stocks essentially the only positive contributors, railroads and consumer staples roughly breakeven and all other sectors in negative territory.
- During the quarter, one-year forward consensus earnings estimates for the S&P/TSX were revised down by about 20%. And while 2021 consensus estimates were also trimmed by about 8%, that was from a high level in anticipation of a sharp earnings rebound. The net impact is that bottom-up estimates for 2021 are still expected to be within about 5% of the 2019 level. The benchmark forward price/earnings multiple has rebounded to about 20x, compared to the 10-year average of 14.7x.

Market Overview

U.S. Equity performance (%) (CAD) as of 30-Jun-20

Source: FactSet. Sector performance based on MSCI sector classification. The analysis of S&P 500 Index constituents are broken out by MSCI defined sectors.

Second quarter 2020 U.S. Equity market review

- The US market, as measured by the S&P 500 Index, moved significantly higher in Q2, bouncing strongly off of its bottom at the end of March. While volatility has come down from the extremely elevated levels seen in Q1, it is still higher on average than it has been over the past several years, as the US and the rest of the world continued to deal with COVID-19.
- Economic growth in the United States was sharply lower during Q1, with GDP of -5.0%. An even larger monetary contraction in Q2 is expected due to the economic impact of the coronavirus. Given this backdrop, the US Federal Reserve has pledged to keep interest rates near zero for an extended period of time and has expanded its quantitative easing program (e.g. large-scale bond purchases).
- For the quarter, growth outperformed value in the large-, mid-, and small-cap spaces. The market rotated toward stocks most likely to benefit from increased consumer and business activity due to states reopening their economies. During Q2, the best-performing sectors were energy, consumer discretionary and technology. Utilities, consumer staples and financials were the weakest sectors on a relative basis.

Canadian Fixed Income performance (%) (CAD) as of 30-Jun-20

Source for benchmark performance SPAR, FactSet Research Systems Inc. All indices represent total return unless otherwise noted.

Second quarter 2020 Canadian Fixed Income market review

- It was the strongest quarterly period on record for the Canadian fixed income market with the FTSE Canada Universe Bond Index returning 5.9%. Positive fixed income market performance was driven by a combination of declining federal government bond yields and tightening credit spreads.
- The Canadian economic and financial system weathered a historic shock during second quarter of 2020 driven by the COVID-19 pandemic and a steep decline in energy prices. An extraordinary global government and central bank response, including that of Canada's, buffered the overall impact.
- Corporate bonds strongly outperformed federals and provincials. The average corporate spread reached a high of 275 bps in late March and narrowed to 160 bps as of June 30. The mid-term corporate index returned 9.0%, outperforming mid-term federals and provincials by 665 bps and 446 bps, respectively.

Asset Summary

Asset Mix view as of JUN-30-20

Policy induced equity recovery which took hold in the last week of March carried on throughout most of the second quarter. The pace of the recovery matched the exceptional pace of the selloff, with certain markets fully recovering and setting new all-time highs in the process.

Monetary authorities globally continued ahead with unparalleled support. The US Federal Reserve announced programs for direct market intervention on the corporate bond side, with the Bank of Canada quickly following suit. The historic monetary response to the pandemic-driven economic shutdown continues to be supplemented by an extraordinary fiscal policy response. While it looks like the depression scenario has been averted, the depth and duration of the downturn remains uncertain and may become even more so once emergency support programs start tapering off.

Against this backdrop, risk assets have retraced most of the losses on the back of policy response and early signs of pandemic lockdown measures working. A gradual reopening of economies globally boosted sentiment and increased the risk appetite of investors.

We believe the recovery across the risk markets in the second quarter has diminished the attractiveness of the equity risk premium, especially given the uncertainty regarding the state of business fundamentals over the next 12 to 18 months. As a result, we decided to pare back the equity exposure and bring the tactical positioning in line with the strategic allocations, resulting in a neutral positioning overall. Within equities, we have maintained the preference for foreign exposure at the expense of the domestic equity market, while the fixed income allocation is overweight bonds at the expense of cash.

Ultimately, we remain optimistic that global markets will rebound once the pandemic and the necessary measures to counter it have run their course, but we also feel equity markets are currently pricing in very little room for disappointment.

¹ Sector allocation is calculated based upon each security's price in local currency.

² Stock selection is calculated based upon each security's price in local currency and included interaction effect. Interaction effect is the portion of the portfolio's relative performance attributable to combining allocation decisions with stock selection decisions. This effect measures the relative strength of the manager's convictions. The interaction effect is the weight differential times the return differential.

Attribution results are generated by the FactSet application utilizing a methodology that is widely accepted in the investment industry. Results are based upon daily holdings using a buy-and-hold methodology to generate individual security returns and do not include fees or expenses. As such, attribution results are essentially estimates and do not aggregate to the total return of the portfolio, which can be found elsewhere in this presentation. To obtain the contribution calculation methodology and a complete list of every holding's contribution to the overall portfolio's performance during the measurement period, please email DLAttributionGrp@MFS.com.

Portfolio Outlook and Positioning

The Low Volatility Canadian Equity portfolio underperformed the S&P/TSX Index in Q2 2020.

Detractors

- Overweight least volatile stocks
- Fundamental research input
- Quantitative models, notably sentiment
- Stock selection in information technology, energy and consumer staples
- Overweight communications services and underweight materials

Contributors

- Underweight the largest market cap stocks
- Stock selection in real estate and financials
- Overweight information technology and underweight financials

Record government and central bank intervention aimed at mitigating the impact of COVID-19 shutdowns generated a robust rebound in equity prices in the second quarter of 2020, reversing the majority of the first quarter's decline. During this second consecutive quarter of extreme market volatility, Canadian equities, based on the S&P/TSX Composite, rose 17%, recapturing much the -21% decline of the first quarter. Canadian equity performance in Q2 was roughly in line with the US and ranked well globally.

Canadian equity performance in Q2 was very narrow, with about 60% of the gain driven by technology and materials stocks, largely ecommerce giant Shopify and the precious metals (gold) stocks. Industrials and financials, which are more cyclical, generally followed the 10-year yield, which declined in line with the subdued growth and inflation outlook. While the price of oil regained roughly half its first quarter price decline, the energy sector underperformed significantly, weighed down by notably weak performance in pipeline stocks. Defensive sectors, such as consumer staples, communication services and utilities, were persistently weak during the period, while health care stocks gave back early quarter strength and ended up slightly underperforming.

The dispersion in performance, measured by market capitalization, in the quarter was also extraordinary, led by a 38.5% gain in the S&P/TSX Small Cap Total Return Index, followed by 25.5% for the S&P/TSX Completion TR Index (mid-cap) and 15% for the S&P/TSX 60 Index (large-cap). Lagging all was the 8.5% increase in the S&P/TSX High Dividend, reflecting the in-quarter rise in interest rates.

45753.2

Portfolio Outlook and Positioning

Factor performance was dominated by beta, price momentum and growth. As would be expected, given the sector and market cap performance referenced above, quality factors, such as ROE and ROIC, underperformed. Despite an increasingly supportive macro and technical backdrop, value factor performance also lagged during the period. Within value, the defensive dividend yield factor was particularly weak, with stocks paying no yields, or low yields, outperforming higher yielding stocks significantly. Earnings momentum performance also lagged, as stocks with the worst earnings revisions produced the strongest performance. Unsurprisingly, with the robust market performance and declining VIX indices globally, the low-volatility factor underperformed significantly during the period.

With the S&P TSX Index posting one of its strongest quarterly returns in history, it should come as no surprise that the MFS Low Volatility Canadian Equity strategy had difficulty keeping up. While the portfolio's emphasis on avoiding the most volatile stocks allowed it to produce respectable absolute performance, the beta driven rally weighed heavily on relative performance. Turning to the research inputs in our investment process, the long-term quality focus of our fundamental research team was understandably challenged during the period, with the stocks rated buy underperforming hold and sell rated stocks by a wide margin. The quantitative models modestly detracted from results, with the sentiment component, which includes share buyback and short interest factors, significantly underperforming. Momentum, valuation and quality factors produced inconsistent results.

As a result of the research input and market performance described above, stock selection in the technology sector, particularly not owning cloud-based ecommerce platform leader Shopify, was the most significant detractor from performance during the quarter. Stock selection and an underweight allocation to the materials sector also weighed on results, as did stock selection in the energy and staples sectors. Contributing to performance was stock selection and the portfolio's underweight position in the financials sector. Additionally stock selection in the real estate sector and an overweight position in the technology sector also benefitted results.

Portfolio positioning

The size, breadth and quick implementation of fiscal and monetary policy helped fuel the unprecedented rally off the March lows and make a retest of the market lows increasingly unlikely. The re-opening of economies and improving mobility data, coupled with broad-based increases in leading economic indicators, suggest a global economic recovery underway. The rotation into higher beta and smaller-cap stocks, coupled with the narrowing of credit spreads, suggest the business cycle is transitioning from contraction to the recovery phase, which should result in more cyclical sector and value factor/style leadership.

Portfolio Outlook and Positioning

While most indicators point to an economic recovery and a corresponding rotation into early cycle leadership, it is unlikely to continue on the current "V" shaped trajectory. Many COVID-19 related risks remain, including a resurgence of the outbreak, a second wave as well as the success and timing of the development/distribution of a vaccine. We firmly believe that the benefits of our research approach will be realized as the post-COVID-19 winners versus losers picture becomes clearer in areas such as insurance, REITs and utilities. We appreciate your patience as we navigate this unique and challenging environment.

¹ Sector allocation is calculated based upon each security's price in local currency.

² Stock selection is calculated based upon each security's price in local currency and included interaction effect. Interaction effect is the portion of the portfolio's relative performance attributable to combining allocation decisions with stock selection decisions. This effect measures the relative strength of the manager's convictions. The interaction effect is the weight differential times the return differential.

Attribution results are generated by the FactSet application utilizing a methodology that is widely accepted in the investment industry. Results are based upon daily holdings using a buy-and-hold methodology to generate individual security returns and do not include fees or expenses. As such, attribution results are essentially estimates and do not aggregate to the total return of the portfolio, which can be found elsewhere in this presentation. To obtain the contribution calculation methodology and a complete list of every holding's contribution to the overall portfolio's performance during the measurement period, please email DLAttributionGrp@MFS.com.

Portfolio Outlook and Positioning

The Low Volatility Global Equity portfolio underperformed the MSCI ACWI Index in Q2 2020.

Detractors

- Overweight least volatile stocks
- Underweight lowest yielding stocks
- Intersection holdings
- Quantitative models, notably valuation
- Stock selection in technology, health care and communication services
- Stock selection in North America

Contributors

- Fundamental research input
- Underweight in financials

Global equities rebounded sharply in the second quarter, closely tracking a recovery in mobility data, from the re-opening of economies and a positive reversal of many leading economic indicators from extremely depressed levels. Global Manufacturing PMI, which provides an indication of the direction of economic trends and has a strong correlation to earnings, improved significantly during the quarter with the June report suggesting a broad-based recovery is emerging. While the V-shaped recovery in equity markets and leading economic indicators is encouraging, a resurgence of COVID-19 cases in a number of geographies in June and a corresponding flattening in mobility data rattled markets suggesting the path forward may be bumpy as governments may be forced to slow or reverse re-opening policies. Other risks that may impact the speed and strength of the recovery include ongoing trade frictions, particularly between the US and China, progress on a COVID-19 vaccine and further policy support.

Market leadership during the quarter was lower quality, beta and narrow and was generally dominated by the "stay at home" stocks, which are heavily influenced by the mega-cap FANG stocks in the US. Markets in the European and Pacific regions generally lagged the broad ACWI benchmark, with Germany, the Netherlands and New Zealand notable exceptions. While emerging markets lagged overall, a number of markets across all regions outperformed significantly including South Africa, Brazil and India.

Portfolio Outlook and Positioning

Sector performance was narrow, with the beneficiaries of the economic lockdowns producing the strongest results. Technology, led by technology software and electronic payment companies, was the strongest performing sector. The consumer discretionary sector also outperformed, benefitting from strength in online retail and home improvement stocks. Strength in media companies also drove outperformance in the communication services sector. The massive expansion of government deficits and central balance sheets to offset the economic contraction benefitted gold stocks and resulted in notably strong performance by the materials sector. Cyclical sectors like financials and industrials underperformed during the quarter; however, performance was quite volatile. Defensive sectors, such as consumer staples and utilities, were persistently weak during the period.

As would be expected, given the sector performance described above, factor performance was similarly narrow and with a few exceptions was led by growth and price momentum globally. While profitability factors like ROE outperformed, other quality factors, such as leverage and accruals, were notably weak. Market cap performance reflected the rotation away from quality, with smaller-cap stocks outperforming larger-caps. Despite an increasingly supportive macro and technical backdrop, value factor performance lagged during the period, with worsening COVID-19 data in the back half of June halting what appeared to be an emerging shift in leadership. Within value, the defensive dividend yield factor was particularly weak, with stocks paying no yields, or low yields, outperforming higher yielding stocks significantly. Earnings revision factor performance declined significantly in April before recovering in May. Unsurprisingly, with the robust market performance and declining global VIX indices, the low-volatility factor underperformed significantly during the period.

With the MSCI ACWI posting one of its strongest quarterly returns in history, it should come as no surprise that the MFS Low Volatility Global Equity strategy had difficulty keeping up. While the portfolio's emphasis on avoiding the most volatile stocks allowed it to produce respectable absolute performance, the beta driven rally weighed heavily on relative performance. Another factor impacting results was the portfolio's exposure to higher-yielding stocks, which was negatively impacted by the overhang of potential dividend cuts and the low-quality nature of the rally. Turning to the research inputs in our investment process, the portfolio's intersection holdings — stocks that are buy rated from both our fundamental and quantitative research sources — produced uncharacteristically weak performance. Strong results from our quality focused fundamental research team were overwhelmed by the performance of the value component of the quantitative models, which were negatively impacted by the very strong performance of the most expensive stocks in the benchmark. Other factors in the quantitative models had a mixed impact on results.

The outcome of the research input performance described above was reflected in weak stock selection in the technology sector across multiple regions. Stock selection also detracted from results in the Europe ex-UK and US health care sectors, the Japan communication

Portfolio Outlook and Positioning

services sector and the US consumer discretionary sector. The portfolio's positioning in a number of sectors, including overweight positions in utilities, real estate and consumer staples, coupled with an underweight position in technology, also detracted from results. Despite the expected challenges against the broad MSCI ACWI, the portfolio's diversification enabled it to outperform the MSCI ACWI Minimum Volatility Index.

Portfolio positioning

The size, breadth and quick implementation of fiscal and monetary policy helped fuel the unprecedented rally off the March lows and make a retest of the market lows increasingly unlikely. The re-opening of economies and improving mobility data, coupled with broad-based increases in leading economic indicators, suggest a global economic recovery underway. The rotation into higher beta and smaller-cap stocks, coupled with the narrowing of credit spreads, suggest the business cycle is transitioning from contraction to the recovery phase, which should result in more cyclical sector and value factor/style leadership. The unprecedented shutting down of most of the global economy in response to COVID-19 makes this downturn unique; however, investors have crowded into a narrow group of mega-cap growth stocks that has driven up the valuation spread between growth and value to the widest level since the tech bubble, which sets up the potential for a powerful reversal.

While most indicators point to an economic recovery and a corresponding rotation into early cycle leadership, the market is unlikely to continue on the current "V" shaped trajectory. Many COVID-19 related risks remain, including a resurgence of the outbreak, a second wave as well as the success and timing of the development/distribution of a vaccine. Additionally ongoing trade frictions, social unrest and the US elections have the potential to dampen the economic recovery and impact investor confidence. We firmly believe that the benefits of our research approach will be realized as the post-COVID-19 winners versus losers picture becomes clearer in areas such as insurance, REITs and utilities. We appreciate your patience as we navigate this unique and challenging environment.

^ FTSE Canada Universe Bond Index

Significant Impacts on Performance

Relative to FTSE Canada Universe Bond Index - second quarter 2020

Contributors	An overweight to corporates and an underweight to federals	The portfolio's overweight and positioning within corporates was a sizable contributor to relative performance. Overweights to energy, industrials, communications and financials helped. Increasing the overweight to BBB's and out-of-index high-yield exposure added. Having exposure to US corporates also helped as the US corporate market outperformed that of Canada.
	Corporate selection	Security selection was a significant contributor across a breadth of corporate industries. Selection within industrials was the largest contributor. Notable contributions came from issuers within autos, technology, telecom, health care and building materials. Owning select midstream energy issuers helped. Selection within financials, particularly insurance, also helped.
	Securitised selection	Positioning within securitised was a strong contributor. Owning CLOs and CMBS helped.
	Provincial selection	Positioning within provincials added. Overweights to Alberta and Manitoba helped.
Detractors	Duration positioning	The portfolio maintained a modest duration underweight for portions of the quarter, which hurt in a declining interest rate environment.

The commentary included in this report was based on a representative fully discretionary portfolio for this product style; as such the commentary may include securities not held in your portfolio due to account, fund, or other limits.

Past performance is no guarantee of future results.

¹ The Average Credit Quality (ACQR) is a market weighted average (using a linear scale) of securities included in the rating categories.

² US Turnover Methodology: (Lesser of Purchase or Sales)/Average Month End Market Value

The MFS portfolio's quality breakdown is based on MFS' own methodology, which is different from that used by the benchmark provider. MFS has not independently verified the benchmark data.

For all securities other than those specifically described below, ratings are assigned to underlying securities utilizing ratings from Dominion Bond Rating Service (DBRS), Standard and Poor's, Moody's Investors Service, and Fitch rating agencies. In cases where the agencies do not agree on the credit rating, the rating is classified according to the following rules: If two agencies rate a security, and the ratings are not equal, use the lower of the two ratings; if three agencies rate a security, use the most common rating; in the rare event that all three agencies disagree, use the middle rating. If four agencies rate a security, use the most common rating; if four agencies rate a security with a two way split, use the lower rating. In the highly unlikely event that all four agencies disagree, consider the three lower ratings applying the three rating methodology rule. Ratings are shown in the S&P and DBRS scale (e.g., AAA). All ratings are subject to change. U.S. Government includes securities issued by the U.S. Department of the Treasury. Federal Agencies includes rated and unrated U.S. Agency fixed-income securities, U.S. Agency MBS, and CMOs of U.S. Agency MBS. Other Not Rated includes fixed income securities which have not been rated by any rating agency.

Portfolio Outlook and Positioning

The Canadian economic and financial system weathered a historic disruption during the second quarter of 2020, driven by the COVID-19 pandemic and a steep decline in energy prices. An extraordinary global government and central bank response, including that of Canada's, buffered the overall impact. Despite the decline in economic activity, capital markets rebounded sharply following their March selloff. It was the strongest quarterly period on record for the Canadian fixed income market, with the FTSE Canada Universe Bond Index returning 5.9%. The Canadian equity market was also up sharply, with the S&P TSX Composite Index returning 8.7% in a risk-on environment. The improving backdrop helped the Canadian dollar, which appreciated 3.5% relative to the US dollar.

Significant portions of the Canadian economy closed, with the government allowing businesses and consumers to engage only in essential activities in order to stem the spread of the virus. Disruptions to global supply chains caused additional challenges. Measures of manufacturing activity, retail sales, wholesale, construction, trade and employment plummeted in April to levels at or below those experienced during the depths of global financial crisis. The fiscal response was significant at the federal, provincial and municipal levels, supporting both businesses and the consumer. Overall, fiscal stimulus efforts totaled 11% of GDP. Meanwhile, the Bank of Canada cut its overnight rate of interest to 0.25% in March, introduced asset purchase programs to support short-term money markets and bond markets and worked with other global central banks to ensure short-term US dollar liquidity. The level of economic activity stabilised in May and June, as the lockdowns eased, and benefited from the swift government response. In the midst of this, Tiff Macklem was appointed governor of the BoC in June. He assured markets that he would expand his predecessor's accommodative monetary stance as needed. Core CPI ended June, well below the BoC's 2% target, at 0.9%. The unemployment rate was elevated, at 13%.

The energy market remained another headwind. The demand for oil plummeted as global activity halted. Meanwhile, supply remained high entering the quarter as OPEC members argued over capacity cuts. The Western Canadian Select oil priced reached a low of \$5.4 in April, 90% below where it started the year. With OPEC cutting output by 10 million barrels per day, the price recovered to \$40 by June 30.

Positive fixed income market performance was driven by a combination of declining federal government bond yields and tightening credit spreads. The government of Canada yield-curve bull flattened during the quarter, with long-term rates declining more than short and midterm yields. The 10-year declined 23 basis points during the quarter to 0.52% (reaching a historic low of 0.49% in May). The 30-year yield fell 34 basis point to 0.99%. Meanwhile, corporate bonds strongly outperformed federals and provincials. The average corporate spread reached a high of 275 basis points in late March and narrowed to 160 bps as at June 30. The midterm corporate index returned 9.0%, outperforming midterm federals and provincials by 665 bps and 446 bps, respectively. The corporate market benefited from BoC support as investors rushed to take advantage of attractive valuations. Strong investor demand allowed companies to access the new

Portfolio Outlook and Positioning

issue market to term out debt and improve liquidity. Year-to-date corporate issuance stands at \$74 billion, which is an amount 48% higher than for the same period in 2019. Within corporates, the lower-quality BBB segment outperformed in a risk-on environment. Higher- beta industries such as energy and communications outperformed. Infrastructure lagged. Within provincials, lower-rated or energy-sensitive provinces such as Alberta, New Brunswick and Saskatchewan outperformed lower- yielding Ontario and Quebec.

US credit markets outperformed those of Canada as the technical forces compressing spreads became even more powerful. Those same forces caused the US market to underperform Canada during the March selloff. The Bloomberg Barclays US Investment-Grade Corporate Index outperformed similar-duration US treasuries by 7.7%. The Bloomberg Barclays US high-yield market rallied from stressed levels, returning 10.2%.

The market outlook remains uncertain. The timing and pace of an economic recovery are dependent on efforts to control the health pandemic within Canada and globally. In our view, while the worst-case scenario appears to have been mitigated, the risk of a second surge of the virus remains a sizable one and when a vaccine will be developed and distributed is unclear. The Canadian consumer has entered the current environment with high levels of debt, which will be an additional headwind. Meanwhile, the Canadian banking system is well capitalised, with strong liquidity, which will be important for the recovery. As highlighted above, monetary and fiscal authorities have moved to a highly accommodative stance and pledged to increase support as needed, which is also critical. The yield of the FTSE Canada Universe Bond Index ended June at a low 1.28%, which may mute forward-looking total returns. The low index yield is driven by historically low government bond rates. Meanwhile, despite the strong rally across spread sectors during the quarter, we view that valuations remain relatively attractive within them. The average Canadian investment-grade corporate spreads at 160 bps, which is above historical average levels. However, the dispersion across issuers has narrowed, and there will most certainly be fundamental winners and losers as the cycle evolves. Thus navigating the environment will require a strong focus on fundamental credit analysis and security selection. We increased our risk budget from conservative positioning across portfolios in late March by adding to our corporate exposures given highly attractive valuations. The level of risk across mandates was maintained or increased depending on portfolio specific objectives during 2Q20. We have been finding opportunities in both the primary and secondary markets. And we are more willing to move down in quality or to more cyclical issuers as the market outlook becomes clearer.

The commentary included in this report was based on a representative fully discretionary portfolio for this product style; as such the commentary may include securities not held in your portfolio due to account, fund, or other limits.

CERTIFICATE OF PORTFOLIO COMPLIANCE

MFS Canadian Core Plus Fixed Income Fund

To the best of my knowledge, for the quarter ending June 30, 2020, MFS Investment Management Canada Limited ("MFS") complied in all material respects with the investment restrictions contained in the applicable Offering Memorandum or Offering Memoranda for the MFS Canadian Core Plus Fixed Income Fund. Such certification is subject to the following conditions: (i) MFS' compliance testing is performed using portfolio valuation reports derived from its internal security inventory system and not the books and records of the Portfolio; and (ii) MFS is responsible for compliance with the investment restrictions as stated in the applicable Offering Memorandum or Offering Memoranda.

MFS Investment Management Canada Limited.
